GoOrder

Online Food Ordering & Delivery Platform

Object-Oriented Programming Project

C++ | OOP | Delivery System

Project Overview

What the platform does

GoOrder Concept

GoOrder is a realistic food ordering and delivery platform developed using C++ and Object-Oriented Programming concepts.

Realistic | Scalable | Role-based

Customers order food

Restaurants manage orders

Riders deliver food

Secure payment & tracking

Main Features

GoOrder

Three different user roles

Customer

- Sign up / Login
- Browse restaurants and menus
- Order food
- Connect bank card
- Track order status

Restaurant

- Receive orders
- Update order preparation status
- Prepare food for rider

Delivery Rider

- Accept delivery requests
- Update delivery progress
- Deliver food to customer

Input and Output

How information moves in the system

GoOrder

System Input

- User information
- Card balance
- Food selection
- Restaurant selection
- Delivery location

System Output

- Total order price
- Delivery fee
- Payment success/failure
- Waiting time
- Order tracking status

OOP Concepts Used

GoOrder

How C++ principles are demonstrated

Encapsulation

Sensitive information such as passwords and bank balances are stored privately.

Inheritance

Customer, RestaurantOwner, and DeliveryRider inherit from the User class.

Polymorphism

Different user roles perform different actions through overridden functions.

Abstraction

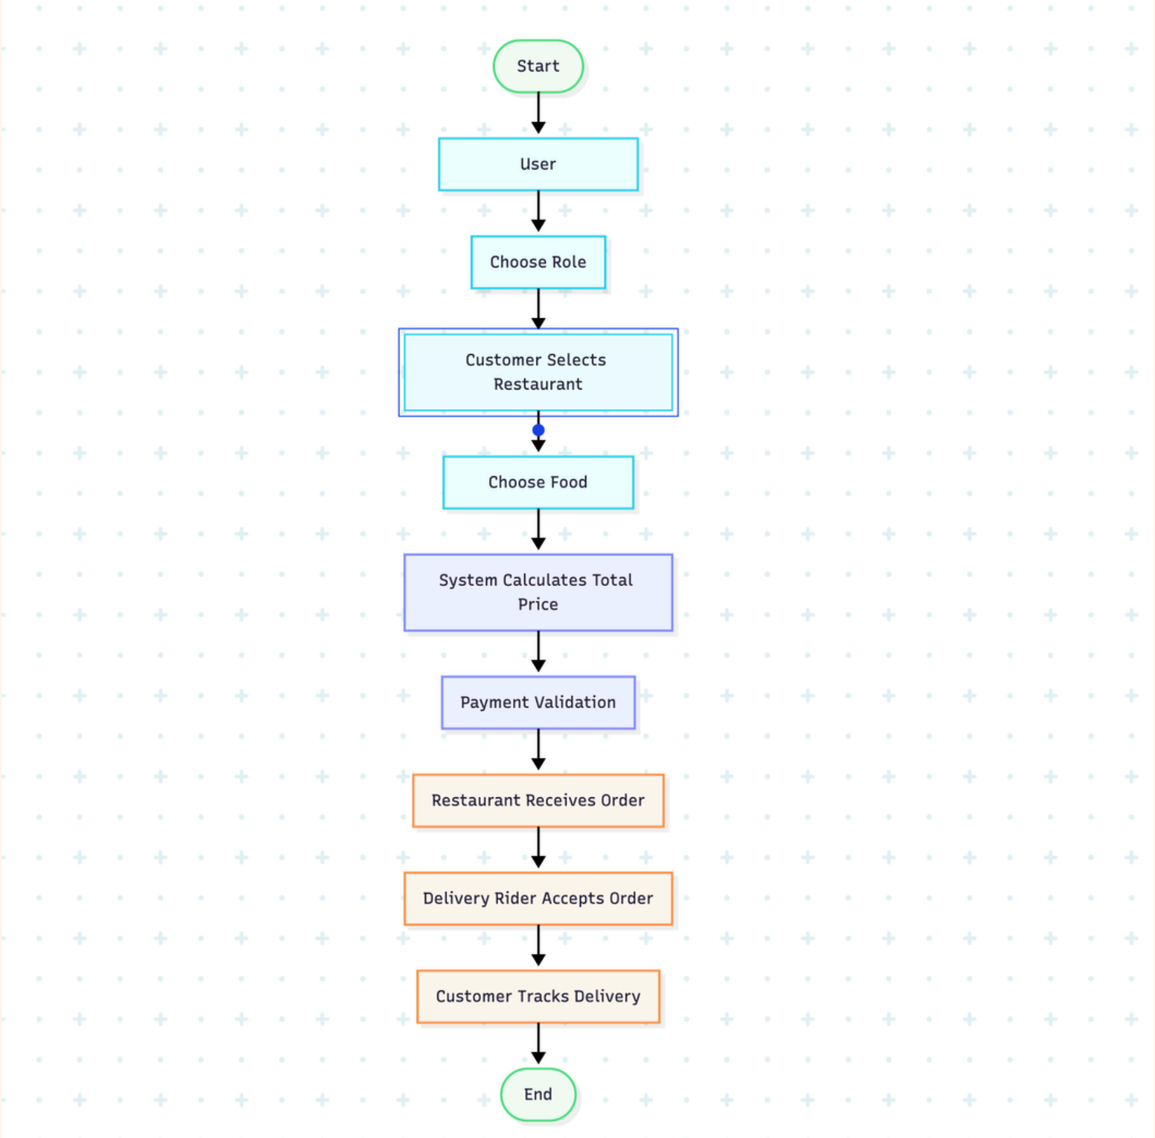

Payment processing and delivery tracking are simplified through class methods.

Main Classes

- User
- Customer
- Restaurant
- DeliveryRider
- MenuItem
- Order
- PaymentSystem
- DeliverySystem

FlowChart

Start
User
Choose Role
Customer Selects Restaurant
Choose Food
System Calculates Total Price
Payment Validation
Restaurant Receives Order
Delivery Rider Accepts Order
Customer Tracks Delivery
End

Conclusion

Final summary

GoOrder is a realistic and scalable food delivery platform that demonstrates important Object-Oriented Programming concepts through real-world system interactions.

- 👥 **User management**
- 🍔 **Ordering systems**
- 💳 **Payment processing**
- 🛵 **Delivery coordination**

One integrated platform built with C++ and OOP.
