Project Progress & Planning Report -> 1st Round Evaluation

Project Name	GoOrder - Online Food Ordering and Delivery Platform
Team Name	GoOrder Team
Members	Yigitalieva Mubina (20253721) Rahmonova Mohinur (20253719)
Topic	Online Food Ordering and Delivery Platform using Object-Oriented Programming in C++.
Reason for selecting the topic	We chose this topic because food delivery platforms are widely used in real life. The project includes different user roles such as customers, restaurants, delivery riders, and an admin, so it is suitable for practicing OOP concepts.
Project Goals	1. Build an interactive console-based food ordering and delivery system. 2. Apply encapsulation, inheritance, polymorphism, and abstraction. 3. Allow users to register, log in, view restaurants, order food, process payment, update order status, and view order information.
Team Rules	1. Complete assigned parts before the deadline. 2. Communicate regularly and share code updates. 3. Write clean, understandable, and tested code. 4. Both members should understand and explain the final project.
Notes and Ideas	Main ideas: customer registration/login, restaurant owner login, rider login, admin login, restaurant menus, food ordering, payment processing, order storage, order status updates, and viewing orders by role. Main classes: User, Customer, DeliveryRider, Restaurant, MenuItem, Order, PaymentSystem, and DeliverySystem.
Individual Task Description	Yigitalieva Mubina (20253721): User base class, customer functions, payment logic, order status update logic, and main menu integration. Rahmonova Mohinur (20253719): Restaurant/menu data, order creation flow, rider functions, and testing the interactive menu.
